

# Function 07 — Notifications & Executive Alerts

## Purpose

Design the complete Notifications experience for HQ.

Notifications keep users informed about important activities across their Headquarters, including mission progress, executive recommendations, approvals, security events, billing, team activity, and system updates.

Notifications should reduce uncertainty, encourage timely action, and ensure users never miss important business events.

---

## Product Context

HQ is an AI Executive Headquarters.

Notifications are official communications from the Executive Team and the HQ platform.

Every notification should answer at least one question:

- What happened?
  - Why does it matter?
  - What should I do next?
  - What happens if I ignore it?
- 

## Product Philosophy

Notifications should be:

- Relevant
- Timely
- Actionable
- Non-intrusive
- Intelligent
- Prioritized

Avoid sending unnecessary alerts.

If a notification doesn't help the customer make a decision or take action, it probably shouldn't exist.

---

## Notification Objectives

The system should allow users to:

- View recent notifications.
  - Prioritize important alerts.
  - Take action directly from notifications.
  - Filter notifications by category.
  - Search notification history.
  - Mark notifications as read or unread.
  - Archive or dismiss notifications.
  - Configure notification preferences.
- 

## Notification Categories

Support categories such as:

### Executive Updates

- CEO briefings.
- Executive recommendations.
- Strategic insights.
- Executive requests for clarification.

### Mission Updates

- Mission created.
- Mission started.
- Mission paused.
- Mission completed.
- Mission awaiting approval.
- Mission failed.
- Deliverables ready.

### Collaboration

- Team member joined.

- Comments added.
- Mentions.
- Shared conversations.
- Shared assets.

## Security

- New device login.
- Suspicious activity.
- MFA events.
- Passwordless verification.
- Permission changes.

## Billing & Subscription

- Trial ending.
- Payment successful.
- Payment failed.
- Subscription upgraded.
- Usage limits approaching.

## Organization

- Team invitations.
- Role changes.
- Organization settings updated.
- New Headquarters activity.

## System

- Scheduled maintenance.
- Service disruptions.
- New features.
- Platform announcements.

---

# Notification Center

The Notification Center should provide:

- Unread notifications.
- Today's notifications.
- This week's notifications.
- Archived notifications.

- Filter by category.
  - Search.
- 

## Notification Card

Each notification should include:

- Executive or system avatar.
- Title.
- Summary.
- Time.
- Priority.
- Related mission or workspace.
- Suggested action.

Example actions:

- View Mission
  - Approve
  - Review
  - Open Conversation
  - Retry
  - Upgrade Plan
  - Dismiss
- 

## Notification Priorities

Define four priority levels:

### Critical

Requires immediate attention.

Examples:

- Security breach.
- Payment failure.
- Mission blocked.

## High

Important business event.

Examples:

- CEO awaiting approval.
- Mission completed.
- Executive recommendation.

## Medium

Useful operational updates.

Examples:

- Team invitation accepted.
- Weekly summary available.

## Low

Informational.

Examples:

- Feature updates.
- Product announcements.

---

## Smart Notification Rules

HQ should intelligently manage alerts by:

- Grouping similar notifications.
- Avoiding duplicates.
- Delaying non-urgent notifications.
- Escalating ignored critical items.
- Respecting quiet hours and user preferences.

---

## Delivery Channels

Support:

- In-app notifications.
- Email.
- Mobile push notifications.
- Browser notifications.
- Daily and weekly executive summaries.

Users should be able to configure which channels they prefer.

---

## Executive Briefings

In addition to individual notifications, HQ should provide periodic summaries such as:

- Daily briefing.
- Weekly executive report.
- Monthly business review.
- Quarterly strategic review.

These summarize activity instead of overwhelming users with individual alerts.

---

## Notification Preferences

Allow users to control:

- Categories.
- Delivery channels.
- Frequency.
- Quiet hours.
- Language.
- Sound and vibration (mobile).

Organization administrators can define default policies.

---

## Premium Experience

Design:

- Elegant notification cards.
- Smooth slide-in animations.

- Real-time badge updates.
  - Clear read/unread states.
  - Priority indicators.
  - Responsive layouts.
  - Light and dark themes.
- 

## Security

Ensure:

- Organization isolation.
  - Role-based visibility.
  - Secure delivery.
  - Audit logging.
  - Protection against notification spoofing.
- 

## Performance

Plan for:

- Real-time updates.
  - Offline synchronization.
  - Efficient pagination.
  - Notification batching.
  - Background delivery.
- 

## Analytics

Track:

- Notifications sent.
- Notifications opened.
- Action completion rate.
- Dismissal rate.
- Delivery success.
- Time to action.
- User preference changes.

---

## Future Evolution

Plan for:

- AI-prioritized notifications.
  - Predictive alerts.
  - Voice announcements.
  - Smart wearable notifications.
  - Executive digest customization.
  - Cross-platform synchronization.
- 

## Deliverables

The blueprint should define:

- Notification lifecycle.
  - UX flows.
  - UI components.
  - Delivery architecture.
  - APIs.
  - Database models.
  - Security rules.
  - Performance requirements.
  - Edge cases.
  - Responsive behavior.
  - Acceptance criteria.
- 

## Recommendation

I recommend introducing a distinctive concept called the **Executive Inbox**.

Instead of presenting notifications as a generic list, users open an **Executive Inbox** where messages appear as communications from their executive team:

- **CEO:** "Your quarterly growth strategy is ready for review."
- **Finance Director:** "Cash flow analysis identified three optimization opportunities."
- **Security Director:** "A new device signed into your Headquarters."

- **HQ System:** "Your organization has reached 80% of its monthly mission allocation."

This reinforces the feeling that users are interacting with an active executive organization rather than a conventional notification system, making the experience both more engaging and more aligned with HQ's brand identity.
