

Phase 3 — Intelligence

Document 1 — Organization Intelligence Architecture

Purpose

Organization Intelligence is HQ's ability to understand an organization as a living business rather than a collection of records.

Its purpose is to create and continuously maintain a **Digital Organization Model** that every AI Executive consults before making decisions.

Instead of repeatedly asking users for context, HQ builds an evolving understanding of:

- Who the organization is
- What it does
- How it operates
- What it wants to achieve
- How it is changing over time

This understanding becomes the foundation for all intelligence within HQ.

Core Principle

HQ should learn the business once and continuously improve its understanding over time.

Users should not have to explain the same things repeatedly.

The Digital Organization Model

Every organization in HQ has a continuously evolving profile composed of multiple intelligence domains.

These domains together represent the organization's digital twin.

Domain 1 — Organization Identity

Defines the basic identity of the organization.

Capture:

- Organization name
- Headquarters name
- Legal entity
- Business registration number (optional)
- Country
- State/Region
- Time zone
- Primary language
- Supported languages
- Currency
- Industry
- Organization size
- Business stage (Startup, Growth, Scale, Enterprise)
- Year founded
- Website
- Social media profiles (optional)

This establishes the organization's identity.

Domain 2 — Business Model

HQ should understand how the organization creates value.

Capture:

- Products
- Services
- Revenue streams
- Target customers
- Customer segments
- Distribution channels
- Pricing strategy
- Sales model
- Geographic markets
- Competitive positioning

HQ should know not only *what* the organization sells but *how* it succeeds.

Domain 3 — Organizational Structure

Represent the company's hierarchy.

Include:

- Headquarters
- Business units
- Departments
- Teams
- Roles
- Reporting relationships
- Decision makers

This enables executives to understand responsibilities and authority.

Domain 4 — Strategic Direction

Capture the organization's purpose.

Include:

- Vision
- Mission
- Core values
- Long-term goals
- Annual objectives
- Quarterly priorities
- Key initiatives
- Success metrics (KPIs)

Every recommendation should align with these priorities.

Domain 5 — Operations

Model how the organization works.

Include:

- Standard operating procedures (SOPs)
- Business workflows
- Approval processes
- Meeting cadence
- Communication preferences
- Working hours
- Compliance requirements
- Operational constraints

This allows HQ to adapt its behavior to the organization's way of working.

Domain 6 — Brand Intelligence

Understand the organization's brand.

Include:

- Logo
- Brand colors
- Typography
- Brand voice
- Tone of communication
- Writing guidelines
- Marketing messages
- Target audience
- Brand assets

Every AI-generated output should remain consistent with the brand.

Domain 7 — Customer Intelligence

Model the organization's customers.

Include:

- Customer personas
- Industries served
- Pain points
- Needs
- Buying journey
- Customer feedback

- Retention challenges
- Growth opportunities

Recommendations should always consider customer impact.

Domain 8 — Market Intelligence

Track the organization's external environment.

Include:

- Competitors
- Market trends
- Industry regulations
- Emerging technologies
- Economic factors
- Opportunities
- Threats

HQ should stay aware of changes affecting the organization.

Domain 9 — Technology Intelligence

Understand the organization's technology landscape.

Include:

- Core software
- Integrations
- APIs
- Data sources
- Infrastructure
- Security requirements
- Development practices

This helps technical executives make informed decisions.

Domain 10 — Organizational Learning

This is where HQ evolves.

Instead of remaining static, HQ continuously refines its understanding based on:

- New conversations
- Completed missions
- Uploaded documents
- User feedback
- Business performance
- Approved recommendations
- Organizational changes

Every approved insight strengthens the Digital Organization Model.

Sources of Understanding

Organization Intelligence should gather knowledge from multiple sources:

During Onboarding

- User-provided information
- Industry selection
- Goals
- Preferences

During Daily Use

- Conversations
- Missions
- Assets
- Decisions
- Analytics
- Team activities

Uploaded Knowledge

- SOPs
- Policies
- Reports
- Presentations
- Contracts

- Product documentation

Connected Systems

- CRM
- ERP
- Accounting
- Project management
- Communication tools

Each source enriches HQ's understanding over time.

Confidence Model

Not all information is equally reliable.

Each piece of organizational knowledge should include:

- Source
- Date captured
- Last verified
- Confidence score
- Verification status

Executives should prefer high-confidence information when making decisions.

Continuous Learning Cycle

Organization Intelligence operates as a continuous loop:

1. Collect new information.
2. Validate and score confidence.
3. Update the Digital Organization Model.
4. Notify relevant executives of significant changes.
5. Improve future recommendations and decisions.

This ensures HQ stays aligned with the organization's evolution.

Design Principles

- **Learn progressively:** Don't overwhelm users with questions upfront.
 - **Respect user control:** Major updates require review or approval.
 - **Maintain transparency:** Show users what HQ knows and allow corrections.
 - **Prioritize relevance:** Focus on information that improves decisions.
 - **Preserve history:** Track changes over time to understand organizational evolution.
-

Deliverables

This document should define:

- The Digital Organization Model.
 - Intelligence domains and relationships.
 - Data sources and learning pipeline.
 - Confidence and verification model.
 - Update and review workflows.
 - Permissions and governance.
 - APIs and database structures.
 - User interfaces for reviewing and editing organizational knowledge.
 - Acceptance criteria and testing strategy.
-

One enhancement I'd like us to add

I think HQ should include an "**Organization Understanding Dashboard.**"

Instead of hiding its internal understanding, HQ should expose it transparently.

It could answer questions like:

- **What HQ knows** about your organization.
- **How confident** it is in each area.
- **What's missing** for better recommendations.
- **Recently learned** information.
- **Suggested updates** awaiting your approval.

This builds trust. Users can see that HQ isn't guessing—it is learning, validating, and improving alongside their business. I believe this transparency will become one of HQ's strongest differentiators.
