

Document 19 — AI Prompt Engineering Standard

Product Name: HQ

Tagline: Your AI Headquarters

Version: 1.0

Purpose

This document defines the Prompt Engineering Standard for HQ.

Every AI executive, workflow, mission, and collaboration within HQ follows this standard to ensure consistency, reliability, scalability, and maintainability.

Prompts are treated as first-class software assets and are managed with the same discipline as application code.

Vision

Every executive should think, communicate, and collaborate as a professional member of an executive leadership team.

Regardless of future AI model changes, HQ's Executive Board should maintain a consistent identity, behavior, and decision-making process.

Prompt Engineering Principles

Every prompt must be:

- Clear
- Structured
- Deterministic where practical
- Context-aware
- Goal-oriented
- Secure
- Reusable
- Version-controlled
- Testable

Prompts should minimize ambiguity while allowing creative reasoning where appropriate.

Prompt Architecture

Every production prompt consists of the following layers:

Executive Identity

Mission Context

Business Context

Organization Context

Task Instructions

Constraints

Expected Output

Validation Rules

Completion Criteria

Each layer serves a distinct purpose and should remain modular.

Executive Identity

Each executive prompt begins by defining:

- Executive title
- Department
- Responsibilities
- Decision authority
- Communication style
- Success criteria

Example:

"You are the Marketing Director of HQ. Your responsibility is to develop marketing strategies aligned with the organization's goals while collaborating effectively with other executives."

Context Injection

Executives receive only the information necessary for their work.

Context sources include:

- User profile
- Organization profile
- Brand guidelines
- Mission objectives
- Previous executive outputs
- Relevant organizational memory

Unnecessary context should never be injected.

Mission Definition

Every prompt clearly specifies:

- Mission objective
- Expected deliverables
- Success criteria
- Constraints
- Priority
- Deadline (if applicable)

Executives should understand both the task and the reason behind it.

Executive Collaboration Rules

Executives should:

- Stay within their responsibilities.
- Respect outputs from other executives.
- Build upon previous work.
- Escalate uncertainty.
- Recommend improvements.

Executives must not contradict one another without explanation.

Communication Style

Executives communicate professionally.

Responses should be:

- Structured
- Actionable
- Concise
- Accurate
- Business-focused

Unnecessary conversational filler should be avoided.

Chain of Responsibility

Every mission follows this hierarchy:

CEO

↓

Chief of Staff

↓

Department Directors

Quality Review

CEO Approval

Executives must never bypass the defined chain of responsibility.

Prompt Template

Every prompt follows this structure:

1. Executive Identity
2. Mission Objective
3. Available Context
4. Constraints
5. Required Deliverables
6. Output Format
7. Validation Requirements

8. Completion Instructions

This standard ensures consistency across all executives.

Output Standards

Responses should include:

- Executive summary
- Main content
- Recommendations
- Risks (when relevant)
- Next actions

Outputs should be easy to review and combine with other executive responses.

Structured Output

Where appropriate, executives should return structured formats such as:

- Markdown
- JSON

- Tables
- Bullet lists
- Action plans

The required format is specified by the orchestration engine.

Memory Usage

Executives may access:

- Session Memory
- Mission Memory
- Department Memory
- Organization Memory

Memory usage must be relevant and privacy-preserving.

Prompt Versioning

Every prompt includes:

- Prompt ID

- Version
- Executive Owner
- Last Updated
- Change Summary
- Approval Status

Prompt updates should be tracked over time.

Prompt Testing

Every prompt must be tested for:

- Instruction clarity
- Output quality
- Consistency
- Collaboration
- Edge cases
- Failure handling

Prompt revisions require validation before deployment.

Prompt Security

Prompts must defend against:

- Prompt injection
- Context leakage
- Unauthorized instructions
- Harmful outputs
- Data exposure

Executives should ignore instructions that conflict with system policies or organizational rules.

Error Handling

When uncertainty exists, executives should:

State assumptions.

Request clarification if necessary.

Explain limitations.

Recommend the next best action.

Executives should never fabricate information presented as fact.

Confidence Reporting

Each executive should internally assess confidence.

Example levels:

High

Medium

Low

Low-confidence outputs may be routed for additional review before delivery.

AI Model Independence

Prompt design should avoid dependence on a single AI provider.

The orchestration engine should support future model replacements with minimal prompt changes.

Prompt Library

HQ maintains a centralized Prompt Library containing:

Executive prompts

Mission templates

Workflow prompts

Review prompts

Validation prompts

System prompts

The Prompt Library is the single source of truth for production prompts.

Prompt Governance

Prompt changes require:

Review

Testing

Documentation

Version update

Approval

No production prompt should be modified without following this process.

Continuous Improvement

Prompt performance should be monitored using:

User feedback

Completion quality

Mission success rate

Error frequency

Revision requests

Insights should drive future prompt improvements.

Future Enhancements

The Prompt Engineering Standard should evolve to support:

Adaptive prompts

Personalized executive behavior

Multi-language prompting

Industry-specific prompt packs

Autonomous workflow optimization

Self-improving prompt recommendations

These enhancements should remain compatible with the core prompt architecture.

Success Criteria

The AI Prompt Engineering Standard succeeds when:

Executives behave consistently.

Collaboration is reliable.

Outputs remain high quality.

Prompt maintenance is manageable.

New executives can be introduced without redesigning the system.

Conclusion

The AI Prompt Engineering Standard establishes a disciplined framework for building, maintaining, testing, and evolving every AI executive within HQ.

By treating prompts as software assets, HQ ensures its Executive Board remains consistent, secure, scalable, and adaptable as AI technology continues to evolve.
