

Function 05 — Mission Control

Purpose

Design the complete Mission Control experience for HQ.

Mission Control is where users transform business goals into structured AI-driven execution. It serves as the operational center for creating, monitoring, collaborating on, reviewing, and completing missions.

Mission Control should feel like directing an executive team—not filling out forms or managing tickets.

Product Context

Every meaningful activity in HQ is organized as a **Mission**.

A mission may involve one executive or multiple executives working together under the CEO's coordination.

Examples include:

- Developing a business strategy.
- Creating a marketing campaign.
- Designing a product roadmap.
- Performing financial analysis.
- Reviewing contracts.
- Researching competitors.
- Planning hiring.
- Building software.
- Generating reports.

Mission Control provides complete visibility into the lifecycle of every mission.

Product Philosophy

Mission creation should be effortless.

Users should describe **what they want to achieve**, not which AI model or executive to use.

HQ automatically:

- Understands the objective.
- Determines required executives.
- Builds the execution plan.
- Assigns responsibilities.
- Tracks progress.
- Delivers results.

The customer focuses on the outcome, while HQ manages the complexity.

Mission Lifecycle

Every mission progresses through clear stages:

1. Draft
2. Submitted
3. CEO Analysis
4. Planning
5. Executive Assignment
6. Execution
7. Review
8. Approval (if required)
9. Delivery
10. Learning & Memory Update
11. Archived

Users should always know the current stage and what is happening.

Mission Control Objectives

Design a workspace that allows users to:

- Create missions naturally.
- View all active and historical missions.
- Monitor progress in real time.
- Collaborate with AI executives.
- Review outputs.
- Approve or request revisions.
- Pause, resume, or cancel missions.
- Search and filter missions.

- Learn from previous work.
-

Areas to Design

Mission Dashboard

Display:

- Active missions.
 - Drafts.
 - Completed missions.
 - High-priority work.
 - Awaiting approval.
 - Recently delivered missions.
-

Mission Creation Experience

Instead of presenting a long form, support natural-language input such as:

"Create a six-month marketing strategy for my company."

HQ should then:

- Understand the request.
 - Identify missing information.
 - Ask only necessary follow-up questions.
 - Generate the execution plan.
-

Mission Workspace

Each mission should include:

- Objective.
- Status.
- Assigned executives.
- Timeline.
- Deliverables.
- Executive discussions.
- Attachments.
- Supporting documents.

- Activity history.
 - Risks.
 - Recommendations.
-

Executive Collaboration

Show:

- Which executives are involved.
- Current responsibilities.
- Work handoffs.
- Collaboration flow.
- Decision summaries.

The collaboration should be easy to follow without exposing unnecessary technical details.

Timeline

Provide a live timeline showing:

- Mission created.
 - CEO review.
 - Planning completed.
 - Tasks assigned.
 - Work started.
 - Reviews requested.
 - Deliverables completed.
 - Mission closed.
-

Human Oversight

Support:

- Pause mission.
- Resume mission.
- Cancel mission.
- Edit objective.
- Request revision.
- Approve outputs.

Users should remain in control while HQ handles execution.

Deliverables

Organize outputs such as:

- Documents.
- Images.
- Presentations.
- Reports.
- Strategies.
- Code.
- Research.

Allow preview, download, version history, and sharing.

AI Guidance

Throughout the mission, HQ should proactively provide:

- Progress updates.
 - Estimated completion times.
 - Risks.
 - Suggestions.
 - Requests for clarification.
 - Recommended next steps.
-

Notifications

Notify users when:

- A mission starts.
 - Clarification is needed.
 - A review is requested.
 - Deliverables are ready.
 - A mission completes.
 - A mission fails.
 - Executive approval is required.
-

Search & Organization

Support:

- Search.
 - Filters.
 - Sorting.
 - Categories.
 - Tags.
 - Favorites.
 - Archived missions.
-

Premium Experience

Design:

- Smooth mission transitions.
 - Live executive activity.
 - Animated progress.
 - Elegant loading states.
 - Meaningful empty states.
 - Clear success and error feedback.
-

Security

Consider:

- Role-based access.
 - Organization isolation.
 - Audit trails.
 - Approval workflows.
 - Data privacy.
 - Secure attachments.
-

Performance

Plan for:

- Real-time updates.
- Large mission histories.
- Background synchronization.

- Optimistic updates.
 - Efficient pagination.
 - Fast search.
-

Analytics

Track:

- Missions created.
 - Completion rates.
 - Executive utilization.
 - Average completion time.
 - User intervention frequency.
 - Customer satisfaction.
-

Future Evolution

Prepare for:

- Recurring missions.
 - Mission templates.
 - Cross-organization collaboration.
 - Automated mission scheduling.
 - Autonomous missions with configurable approval policies.
 - AI-generated quarterly and annual business plans.
-

Deliverables

The blueprint should define:

- User journeys.
- Information architecture.
- UX flows.
- UI layouts.
- Component hierarchy.
- AI behavior.
- Backend services.
- APIs.
- Database entities.
- Security.

- Testing.
- Edge cases.
- Responsive behavior.
- Acceptance criteria.

One enhancement I'd recommend

Mission Control should include a "**Mission Brief**" before execution begins.

After the user submits a request, the CEO presents a concise briefing:

- **Mission Objective**
- **Why this mission matters**
- **Executives assigned**
- **Estimated duration**
- **Expected deliverables**
- **Potential risks**
- **Success criteria**

The user can then:

- **Approve & Launch**
- **Edit Mission**
- **Save as Draft**
- **Cancel**

This gives users confidence that HQ has correctly understood their intent before the executive team begins work, reinforcing trust while keeping them in control.
